LOW-SPEED AERODYNAMIC CHARACTERISTICS OF A LARGE-SCALE
45° SWEPT-BACK WING WITH PARTIAL-SPAN SLATS,
DOUBLE-SLOTTED FLAPS, AND AILERONS

By Harry A. James

SUMMARY

Experimental data from force and pressure tests on a large-scale, semispan, wing-fuselage model are presented. The wing had 45° of sweep-back, an aspect ratio of 6, a taper ratio of 0.5, and an NACA 64A010 section normal to the quarter-chord line of the unswept panel and was equipped with partial-span slats, aileron, and double-slotted flaps. Longitudinal force and moment characteristics are given for the model with various combinations of slat spans, with and without double-slotted flaps. Rolling-moment data for various aileron deflections are also included.

Pressure-distribution measurements in tabulated form are included for five of the more significant configurations tested.

INTRODUCTION

Low-speed test results on two large-scale 45° swept-back wings, one with and the other without camber and twist, equipped with partial-span, double-slotted flaps were reported in reference 1. As a continuance of the program of investigating the effects of various high-lift devices, tests have been made in the Ames 40- by 80-foot wind tunnel using the plain wing equipped with partial-span slats along with the same double-slotted flaps previously used. Aileron-effectiveness data also are included for the various configurations tested. The bulk of these force and moment tests were made at a Reynolds number of 8×10^6 ; however, for tests of some configurations the Reynolds number was varied from 2.5 to 8×10^6 .

In order to make these data available in a minimum of time after testing, no analysis of results is included.

NOTATION

The data are presented in the form of standard NACA coefficients which are applicable to a full-span configuration except for the rolling moment. The pitching moments are referred to the quarter-chord point of the mean aerodynamic chord (fig. 1).

C_D drag coefficient $\left(\frac{\text{twice drag of semispan model}}{qS} \right)$

C_l rolling-moment coefficient $\left(\frac{\text{rolling moment due to deflection of one aileron}}{qSb} \right)$

C_L lift coefficient $\left(\frac{\text{twice lift of semispan model}}{qS} \right)$

$C_{L_{\max}}$ maximum lift coefficient

$C_{L_{sep}}$ lift coefficient for which there is an abrupt increase in the rate of drag rise

C_m pitching-moment coefficient $\left(\frac{\text{twice pitching moment of semispan model}}{qSc} \right)$

L lower surface of wing

P pressure coefficient $\left(\frac{p_l - p_0}{q} \right)$

MODEL AND APPARATUS

The principal dimensions of the semispan wing-fuselage model used in this test are shown in figure 1. The test model is essentially identical to the plain-wing model described in reference 1 having an aspect ratio of 6, a taper ratio of 0.5, and an NACA 64A010 section normal to the quarter-chord line of the unswept panel as shown in figure 1. Photographs of the semispan test installation are shown in figure 2.

Details of the aileron, slats, and double-slotted flaps are given in figure 3. The coordinates for the wing section and auxiliary

~~REDACTED~~

high-lift devices in planes normal to the quarter-chord line are given in tables I to IV, inclusive. Only one slat setting (section S-S as shown in fig. 3) was used throughout the test. Five slat spans were tested, all with the outboard end at 97-percent semispan and extending inboard from this point approximately 17, 37, 57, 77, and 83 percent (entire exposed leading edge) of the semispan. Details of the installations are shown in figure 3. The slat spans, as discussed in this report, are referenced to the intersection of the quarter-chord line with lines extending from the slat end points as shown in figure 3. The gap between the foreflap and main flap as used for the model of reference 1 was increased slightly to insure a smaller percentage change in this gap for the various flap deflections tested. Unless otherwise noted, the main flap was deflected 55°. The aileron was sealed by means of masking tape on the lower surface at the intersection of the aileron and wing to prevent air leakage from the lower surface to the upper surface.

The orifice stations are located on the basic plan form as noted in figure 4. Stations I, III, and VI correspond to the streamwise stations as used in the previous tests on this wing (reference 2).

TESTS AND CORRECTIONS

The force and moment tests of the semispan model with the various high-lift devices were made through an angle-of-attack range to include, as near as practical, zero and maximum lift.

The tests, in general, were made at a Reynolds number of 8×10^6 (based on the wing mean aerodynamic chord of 6.21 ft) which corresponds to a dynamic pressure of about 55 pounds per square foot and a Mach number of 0.2.

The main flap of the double-slotted flap was deflected 45°, 50°, 55°, and 60° and the aileron $\pm 10^\circ$, $\pm 15^\circ$, and $\pm 20^\circ$ as measured in planes normal to the quarter-chord line.

The following jet boundary corrections, computed from the method of reference 3 for a semispan unswept-wing installation without flaps, were added to the angle-of-attack and drag-coefficient data:

$$\alpha = 0.25 C_L$$

$$C_D = 0.0045 C_L^2$$

No corrections were made for the tunnel-floor boundary-layer air or for the leakage through the clearance gap (maximum of 1/2 inch) between the fuselage and the tunnel floor because these effects were found to be negligible.

The rolling-moment data for one aileron deflected, as presented, have not been corrected to correspond to that which would be obtained under an antisymmetric type of loading. A comparison of the theoretical symmetric and antisymmetric loading calculated by the methods of references 4 and 5 has shown this tunnel-wall correction to be negligible for this particular wing plan form. The pitching moments for the configurations with aileron deflected correspond to those that would be obtained on a full-span wing with the ailerons used as outboard flaps or elevons.

RESULTS

The lift, drag, and pitching-moment characteristics of the semi-span wing-fuselage model (including fuselage forces) are presented in figures 5 through 24. The data, unless otherwise designated, are for a Reynolds number of 8×10^6 . The results obtained with the slats extended are presented in figures 5 and 6, and with the aileron deflected, in figures 7 through 18. Data obtained for various deflections of the double-slotted flaps are shown in figures 19 and 20. Data obtained for various Reynolds numbers are included in figures 21 to 24.

Cross plots of $C_{L_{max}}$ and $C_{L_{sep}}$ versus slat span and Reynolds number are presented in figures 25 to 28. The variation of C_L for $\alpha = 0^\circ$ with flap deflection is shown in figure 29.

Pressure data are presented for the slat extended condition for slat spans from 14- and 40-percent semispan to 97-percent semispan with and without flaps deflected, and also for the clean wing (slats retracted and sealed) with flaps deflected. The pressure data for these five configurations are included after the figures of force data in tables 5 through 9.
